COMMENTS				
<p>For the sprint 1 task, I can see everything is fairly implemented no obvious problem to me other than the company class not having a type field ... any company should have a type field that will later on be used to identify which form should we display for the new investors ... this is crucial for the whole project ... you must fix that as soon as possible ... Now apart from sprint 1, here are few comments for the current master branch status of today March 27th ..... I can see you guys are connecting to mongoose in multiple routes which is unnecessary and can even cause problems down the road, but since Mongo wasn't required this sprint your grade will not be affected now, am just pointing this out ... There is no need to add company name in english and in arabic as 2 different fields .. there should be a single field for the company name no matter which language it is written in ... You guys need to handle the edge cases when a company attempts to update its info it should change state from being approved to being under review once again every time an update of info is being requested ... so far you don't handle these cases .. The company model does not have a field for the type of the company .. each company must have a type .. you forgot to link the company with one of the 2 forms by adding a field in company model to show which type it is ... A lot of models repeat fields like username age id ... which all belong to any user in general .. you are repeating lots of code in this case and the models could be written in a much more cleaner way, but as you have been still exploring Mongo I do appreciate the effort you made in that sprint, good work everyone</p>
